Rosalyns Beach Hotel

PRIMARY CHANNELS

DELIVERY FOCUS

Stable front-office operations, connected restaurant workflows, secure records, and controlled system support.

Platform Coverage

The PMS service includes booking operations, folios, POS integration, room service, housekeeping workflows, stock operations, events support, guest messaging, reports, analytics, and controlled administration. These modules are intended to work together as one operational platform rather than as isolated tools.

Availability and Uptime

The delivery target is a stable operational environment supported by planned maintenance windows for security and release management. Critical workflows should remain usable during short connectivity interruptions wherever offline-tolerant behaviour is part of the design, then synchronise safely once the network is restored.

Security and Access Controls

The PMS uses prepared statements, authenticated sessions, CSRF validation, controlled API access, and encrypted transport. Sensitive settings should not be exposed through public endpoints. Access rights should be aligned to role so operational staff see only the tools required for their duties, while admin actions remain traceable for audit visibility.

Hardware Deployment Model

POS stations should use dedicated touch tablets, while KDS, BDS, and CDS boards can run as fixed browser displays through Raspberry Pi kiosk nodes connected to mounted monitors. Larger-screen laptops or desktops remain the right choice for administration, reporting, exports, and configuration tasks.

Support Rhythm

Support includes issue triage, security maintenance, supervised feature improvements, and operational guidance after launch. Critical faults should be escalated first, while lower-risk enhancements are scheduled through controlled rollout cycles to protect live hotel operations.

Data Continuity and Exit

All hotel data remains the Client's information. If the relationship ends, records should be exportable in practical formats for continuity. Exit handling should provide enough lead time for data transfer, device retirement, access closure, and a clean operational handover.

Agreement Positioning

This document defines the technical and operational posture of the PMS relationship. Detailed commercials, milestone timing, and negotiated billing arrangements should sit with the signed agreement package rather than being treated as part of a public-facing summary document.
