

Rosalyns Beach Hotel

Managed delivery guide for Rosalyn's integrated hospitality platform, including the operating model, service responsibilities, security posture, support standards, and deployment structure.

OPERATIONS COVERAGE

Bookings, POS, room service, housekeeping, stock, events, analytics, and guest communications run as one coordinated system.

DELIVERY MODEL

Implementation, workflow configuration, device setup, onboarding, launch support, and structured post-go-live maintenance.

PROPERTY CONTACT

Scope of Service

The platform covers front-office booking operations, folios, touchscreen POS, room service, kitchen and beverage display boards, housekeeping, stock control, events support, payment handling, guest messaging, reporting, and role-based administration. The intended result is a single operational system that reduces duplicate work across hotel departments.

Delivery Responsibilities

ProManaged IT handles implementation planning, process configuration, device preparation, operational testing, launch supervision, and structured support after go-live. The system is not supplied as a loose collection of tools; it is deployed as an integrated operating environment that is tuned to the property's workflow.

Deployment Structure

POS stations should use dedicated touch tablets. Kitchen, bar, and coffee boards can run as browser-based display endpoints using Raspberry Pi units connected to fixed HDMI monitors in kiosk mode. Admin work is best carried out on larger-screen laptops or desktop-class devices where dashboards, exports, and reports are easier to manage.

Support and Continuity

The support model includes issue triage, operational guidance, security maintenance, and supervised feature improvement. Critical faults are prioritised first, while non-critical enhancements are grouped into controlled release cycles. Offline-tolerant workflows are used where possible so short network interruptions do not immediately stop service operations.

Data Ownership and Security

All guest, booking, payment, and operational records remain the Client's data. The system relies on prepared statements, authenticated sessions, CSRF controls, rate-limited APIs, and transport encryption. Sensitive settings are not intended for public exposure, and operational events should remain traceable through controlled logging and administration patterns.

Commercial Positioning

This agreement summarises the operating model and service structure. Detailed commercials, rollout milestones, and negotiated billing terms should sit inside the signed agreement package rather than turning this document into a public-facing pricing sheet.

Term and Exit Handling

The service begins on agreed launch terms and should include clear renewal, notice, and transition handling. If the relationship ends, the exit process should support a controlled data export, staff communication, and an orderly retirement of live service endpoints so hotel operations are not disrupted.
